### HISTORICAL NEWS & VIEWS: REPRODUCIBILITY

## Double-dipping revisited

Robust conclusions require rigorous statistics. In 2009 a seminal paper described the dangers and prevalence of double-dipping in neuroscience. Ten years on, I consider progress toward statistical rigor in neuroimaging.

Non-Independent

Independent

Double dipping can produce an effect where there is none

Can also distort a true underlying effect

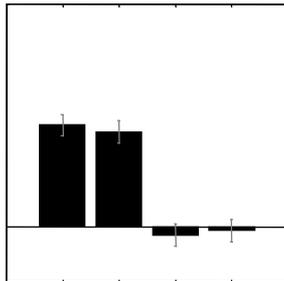

# Simulation:

## Regional activation analysis

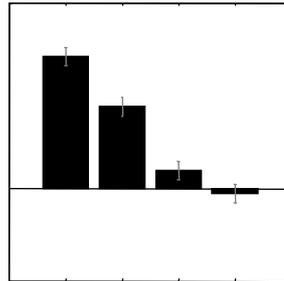

- 3D voxel volume (30 x 30 x 20 voxels)
- Block-design experiment
- 4 conditions (A, B, C, D)
- Spatiotemporal noise:  
Gaussian, slightly spatially smoothed

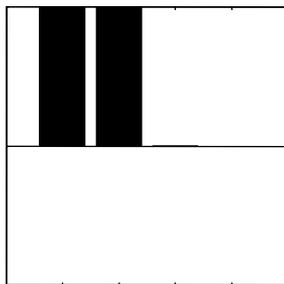

**independent-data  
ROI**

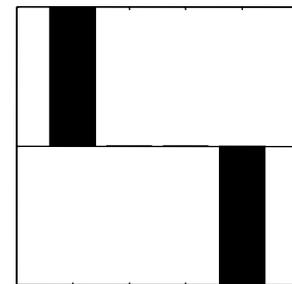

**same-data  
ROI**

**blending continuum**

**truth**

**hypothesis**

# Simulation: Regional activation analysis

- Double dipping can produce distortions of the data even when there is a true underlying effect

# Example 2

## Multivariate Pattern Analysis (MVPA)

# Example 2: MVPA

Simmons, Martin et al. 2006

**TASK**  
(property judgment)

Animate/  
Inanimate? | Pleasant/  
Unpleasant?

**STIMULUS**  
(object category)

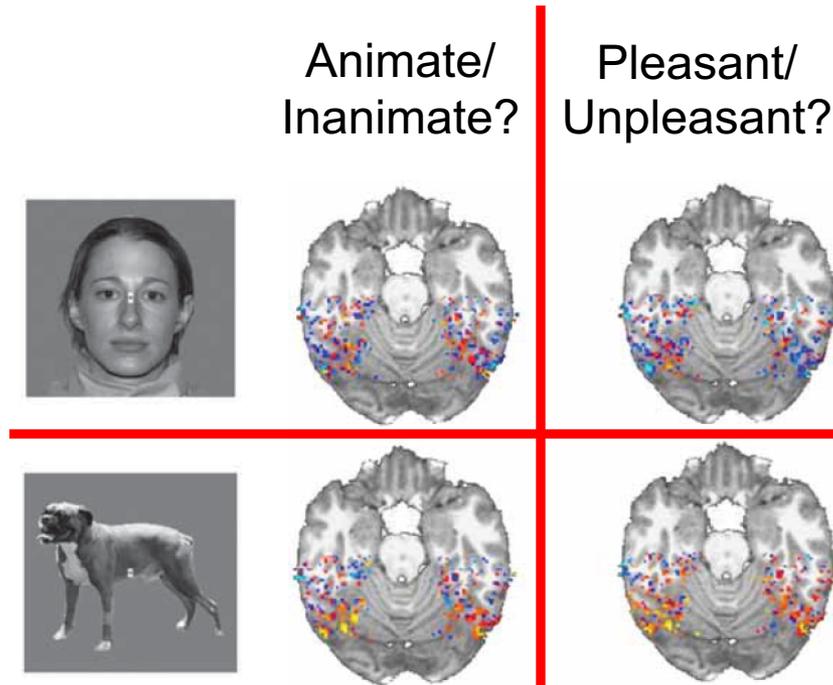

# Example 2: MVPA

Simmons, Martin et al. 2006

**TASK**  
(property judgment)

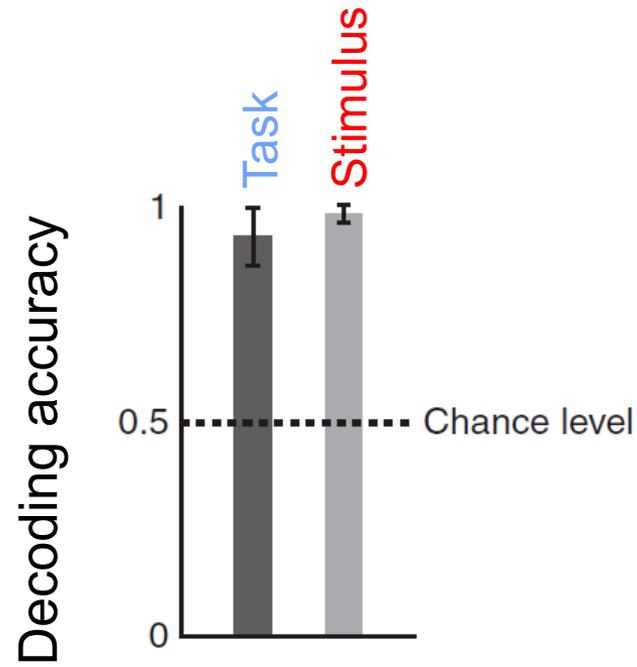

**STIMULUS**  
(object category)

## Split-half analysis (Haxby et al., 2001)

- Define ROI
  - Select voxels for which any pairwise condition contrast is significant
- Correlation analysis
  - Split data in half (training and test)
  - Compare activity patterns for same versus different conditions

# fMRI data

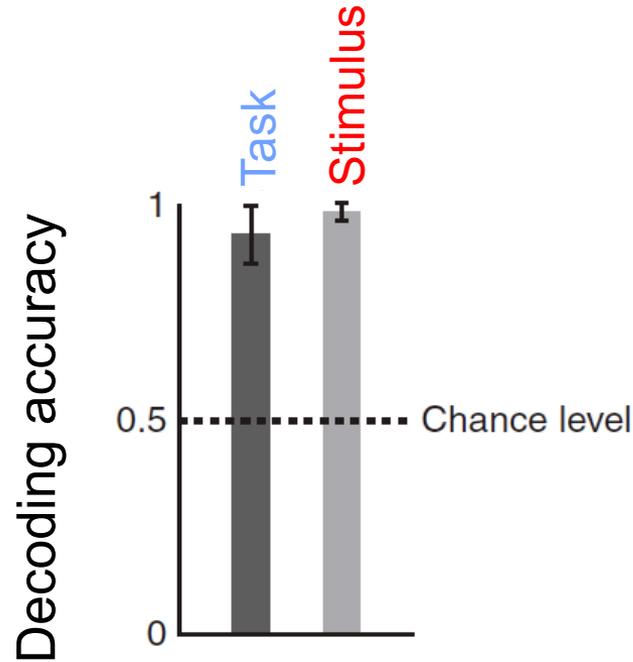

But training and test were independent....

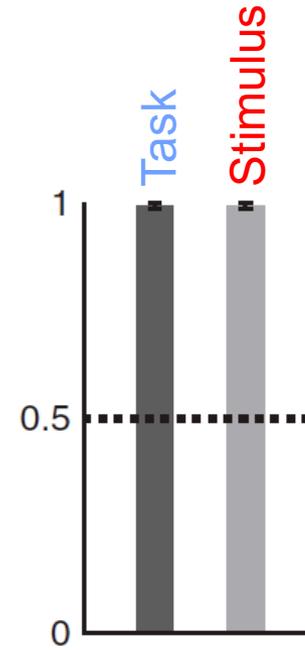

All data used to select voxels

Half data used to select voxels

fMRI data

Random generator data

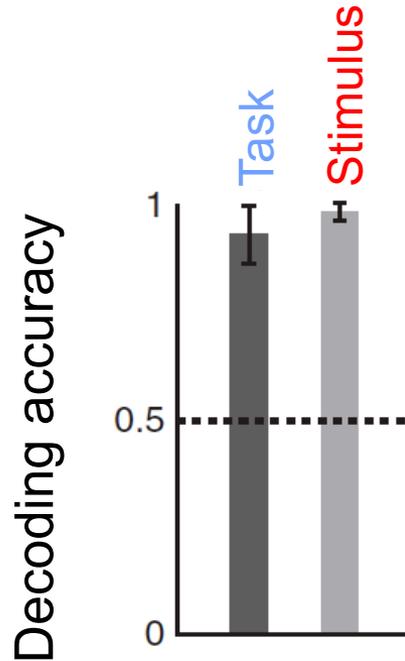

But training and test were independent....

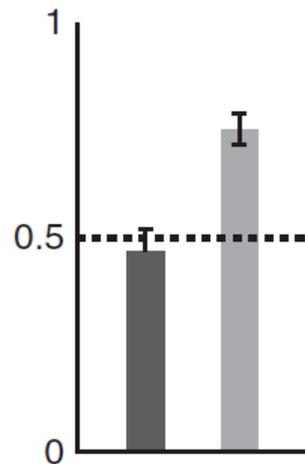

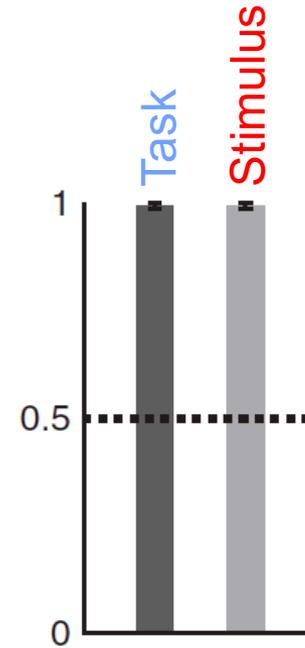

All data used to select voxels

Half data used to select voxels

fMRI data

Random generator data

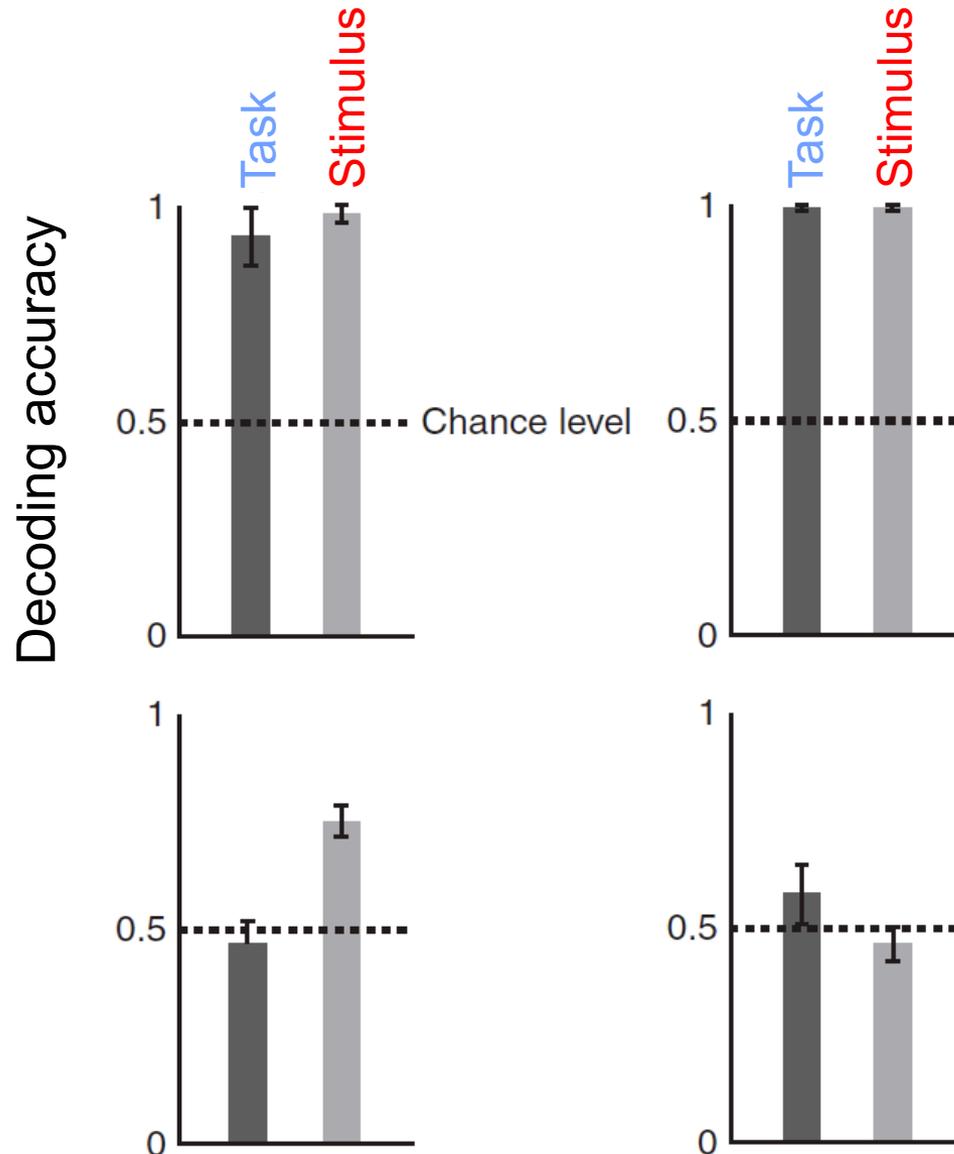

But training and test were independent....

All data used to select voxels

Half data used to select voxels

fMRI data

Random generator data

## Example 2: Multivariate Pattern Analysis (MVPA)

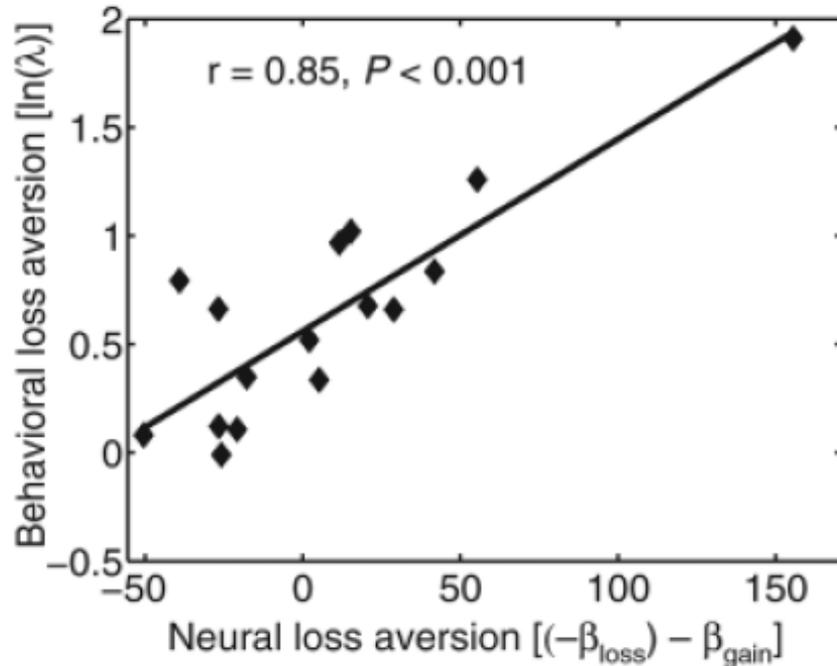

- Test data must not be used in
  - Training the classifier
  - Defining the ROI

# Circular inference

# Circular inference

# How do assumptions in fMRI produce circularity?

- Selection

# Selective Analysis

- Powerful and essential tool
  - Increasingly large datasets
- Common throughout neuroscience

# How do assumptions in fMRI produce circularity?

- Selection
  - When the results statistics are not independent of the criteria used for selection
- Why?
  - Selection is based on true effects + noise

# Types of selection

- Binary selection
- Continuous selection (weighting)
- Sorting

# Examples of selection

- fMRI
  - ROI or voxels of interest

Double dipping is not just a  
problem for fMRI

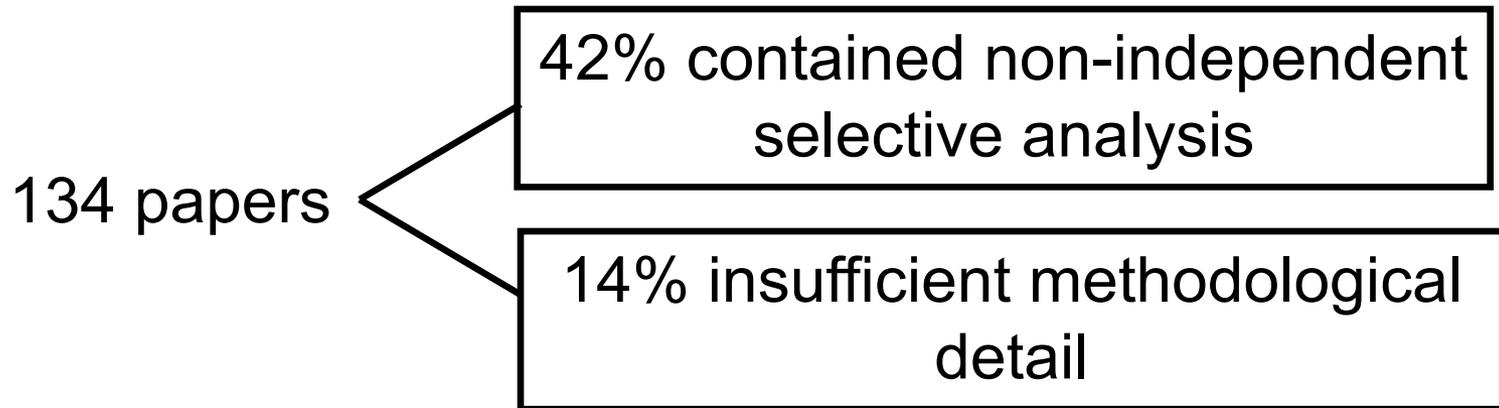

# Examples of selection

- **fMRI**
  - ROI or voxels of interest
- **Single-unit recording**
  - “typical” neuron
  - pre-specified selectivity e.g. visually responsive
- **EEG/MEG**
  - Sensors or waveforms of interest
- **Behavior**
  - Sorting participants by performance e.g. fast learners versus slow learners
- **Gene microarrays**
  - Subsets of genes

# How common is double dipping?

- All fMRI articles published in 2008 in
  - Nature
  - Science
  - Nature Neuroscience
  - Neuron
  - Journal of Neuroscience

# How common is double dipping?

These papers may not be wrong in their main claims, but it's very difficult to know how much of a bias has been introduced

How common is double dipping?

Today?

# Take Home Message

Data selection should be independent from any other data testing
